

# Hypothesis Test for the PMCC

The Product Moment Correlation Coefficient calculates the strength of the linear correlation between two variables assuming that the sample it was calculated from was taken:

- Randomly
- Independently

If our assumptions are correct, we can infer the results to the rest of the population.

A hypothesis test on our results allows us to determine if our calculated value for the PMCC is statistically viable.

For the purposes of the hypothesis test, let  $\rho$  (the Greek letter 'rho') represent the value of the PMCC

## **\*\*REMEMBER\*\***

- The value of the PMCC is a score between -1.0 and +1.0
- A negative value implies a negative correlation between the two variables
- A positive value implies a positive correlation between the two variables
- The closer the value is to zero, the weaker the correlation is

-1.0	-0.9	-0.8	-0.7	-0.6	-0.5	-0.4	-0.3	-0.2	-0.1	0	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
Very Strong Negative Correlation	Strong Negative Correlation	Moderate Negative Correlation					Weak Negative Correlation	Weak Positive Correlation	Moderate Positive Correlation					Strong Positive Correlation	Very Strong Positive Correlation					

## How to identify a PMCC Hypothesis Test:

- ✓ you are looking for a correlation between two variables
- ✓ the data is numerical and linear
- ✓ you may have been given the PMCC somewhere in the question

Important notation:

- $\rho$  = 'rho' This Greek letter represents the 'correlation'

# How to set out your answer

$H_0$	$\rho = 0$ (there is no correlation between X and Y)
$H_1$	$\rho > 0$ (there is a positive correlation between X and Y) $\rho < 0$ (there is a negative correlation between X and Y) $\rho \neq 0$ (there is a correlation between X and Y)

1 if $>$ or $<$ 2 if $\neq$	<b>tailed</b>
--------------------------------	---------------

5% unless otherwise stated	<b>% significance level</b>
-------------------------------	-----------------------------

<b>Test Statistic</b>	The value of the PMCC
-----------------------	-----------------------

<b>Critical Value</b>	Taken from Table 8 in the formula booklet
-----------------------	---

<b>Test Statistic</b>	$>$ or $<$	<b>Critical Value</b>
<b>Hence we</b>	Reject (if the TS lies in the CR)	$H_0$
<b>Therefore there is</b>
